What is Hepatitis B?

Hepatitis B is a liver disease due to an infection by the HVB virus. It can cure by itself, but this disease can also develop during a long time without any visible sign. Therefore, if it is no treated, it can cause a cirrhosis or a liver cancer.

Is Hepatitis B frequent?

Yes. In France, 280 000 people suffer from Hepatitis B and 3 million have already been infected by this disease. Unfortunately, half of them did not get screened and don't know that they are bearers of the virus.

In the world, this disease is very frequent since we assess that about 350 million of people infected have a chronic Hepatitis B.

How do we catch Hepatitis B?

The Hepatitis B virus is very contagious and is easily transmitted through the different body fluids (blood, sperm, saliva...):

➔ between close people (for example between partners during sexual intercourses, parents and children living within the same household)

➔ through objects that have already been used by a contaminated person (razors, toothbrushes, nail scissors, piercing or tattoo instruments, injection equipments, sniffing straws...)

➔ to the baby during the pregnancy or at the time of delivery.

How to know if we suffer from Hepatitis B?

A simple blood test is enough to check it.

What to do if we are bearer of the Hepatitis B virus?

If the screening is positive, you can be treated. You will be sent to a specialist doctor. He/She will prescribe you tests to know the state of the liver and if it is necessary to start a treatment. Today, there are effective treatments that can prevent the complications of the disease and sometimes, cure it completely if they are started in time.

Your family circle will also be able to be screened and protected through vaccination.

What to do to avoid catching Hepatitis B?

The transmission to the sexual partner can be avoided with the use of a condom.

The transmission from the mother to the child requires the combined use of immunoglobulins and vaccination injections.

However, vaccination remains the most effective prevention tool to avoid getting contaminated by the Hepatitis B virus.

Where to get screened in Paris?

> With your family doctor

> In one of the 12 free and anonymous screening centres (CDAG):

CDAG Croix rouge,

43, rue de Valois, 1^{er} - Métro : Palais Royal, Bourse
Tél. : 01 42 97 48 29
